ABSTRACT OF THE DISCLOSURE

The vehicle operation control apparatus multiplies the variable gain G controlled based on the vehicle velocity V, the steering angle 0h, the steering angle velocity wh and the actual 5 steering angle 0T with the steering angle 0h, and controls the actual steering angle 0T of the driven wheels on a result of this multiplication. Consequently, the additional turning time gear ratio Gal or the turning-back gear ratio Ga2, set up individually, can be selected depending on the turning direction of the steering wheel. Therefore, the steering feeling both at the time of additional turning and turning-back can be improved.
